

PRODUCTION PERFORMANCE & QUALITY REPORT

Facility: Main Manufacturing Plant Reporting Period: Weekly Summary

Executive Summary:

The manufacturing production performance report captures activity across multiple database tables, showing a total planned quantity of 1500.0 with 1000.0 completed across active work orders. Machine utilization varies widely, reaching up to 120.0 percent on Assembly Station #1 and dropping as low as 60.0 percent on CNC Lathe #1. Shift production recorded a high output of finished goods led by Shift A with 4700.0 units on machine M001, alongside documented rejections and scrap quantities. Material rejections were notably driven by HDPE Cap 28mm with 100.0 rejected quantity due to flash defects.

1. Weekly Production Trends

Production Analysis:

Work order analysis indicates a completed order of 1000.0 planned units achieving 1000.0 completed units status, while a second planned work order of 500.0 planned units currently shows 0.0 completed units. This reflects mixed operational pacing where active execution is completed for one order while the subsequent order remains in the planned stage.

Day	Target	Actual	Status
WO-Completed	1000	1000	On Track
WO-Planned	500	0	Below Target

2. Machine Performance (OEE Breakdown)

OEE Overview:

Capacity analysis data across 11 records demonstrates fluctuating machine utilization percentages ranging from a low of 60.0 percent on CNC Lathe #1 to a peak of 120.0 percent on Assembly Station #1. Several machines exceeded 100.0 percent utilization, indicating intensive scheduling during specific dates in June 2026.

Line	OEE Score	Status
CNC Lathe #1	115.0%	Optimal
CNC Lathe #2	80.0%	Below Target
CNC Mill #1	95.0%	Optimal
Assembly Station #1	110.0%	Optimal
Auto Assembly Line	80.0%	Below Target
CNC Lathe #1	90.0%	Optimal
CNC Lathe #2	70.0%	Below Target
CNC Mill #1	100.0%	Optimal
Assembly Station #1	80.0%	Below Target
CNC Lathe #1	60.0%	Below Target
Assembly Station #1	120.0%	Optimal

3. Rejection vs. Production Volume by Shift

Shift	Output	Rejections	Defect Rate
Shift A	7100	175	2.4%

Shift Efficiency Analysis:

Shift performance from weighing machine data highlights Shift A as the highest volume contributor, producing 4700.0 finished goods on M001 with 50.0 rejections and 20.0 scrap. Shift B on M001 registered zero finished goods output with 20.0 rejections and 15.0 scrap, pointing to potential downtime or maintenance intervals.

4. Scrap Analysis & Waste Distribution

Key Scrap Drivers:

Rejection and scrap analysis identifies specific material failure modes from the database. HDPE Cap 28mm is the largest contributor to rejections with 100.0 units rejected due to flash defects, representing a significant portion of total quality losses.

5. Corrective Action Plan

Action Item	Target Area	Owner	Deadline
Investigate mold parameters to address flash defects on HDPE Cap 28mm	Assembly / Molding Line	Quality Control	2026-07-31
Review scheduling and maintenance for underperforming machines showing 60% utilization	CNC Lathe #1	Maintenance Department	2026-08-05
Initiate execution of the pending planned work order to meet production targets	Production Floor	Production Management	2026-07-25
